Molecular Biology 101

Importance of Transcription

Disease-Associated DNA Bases

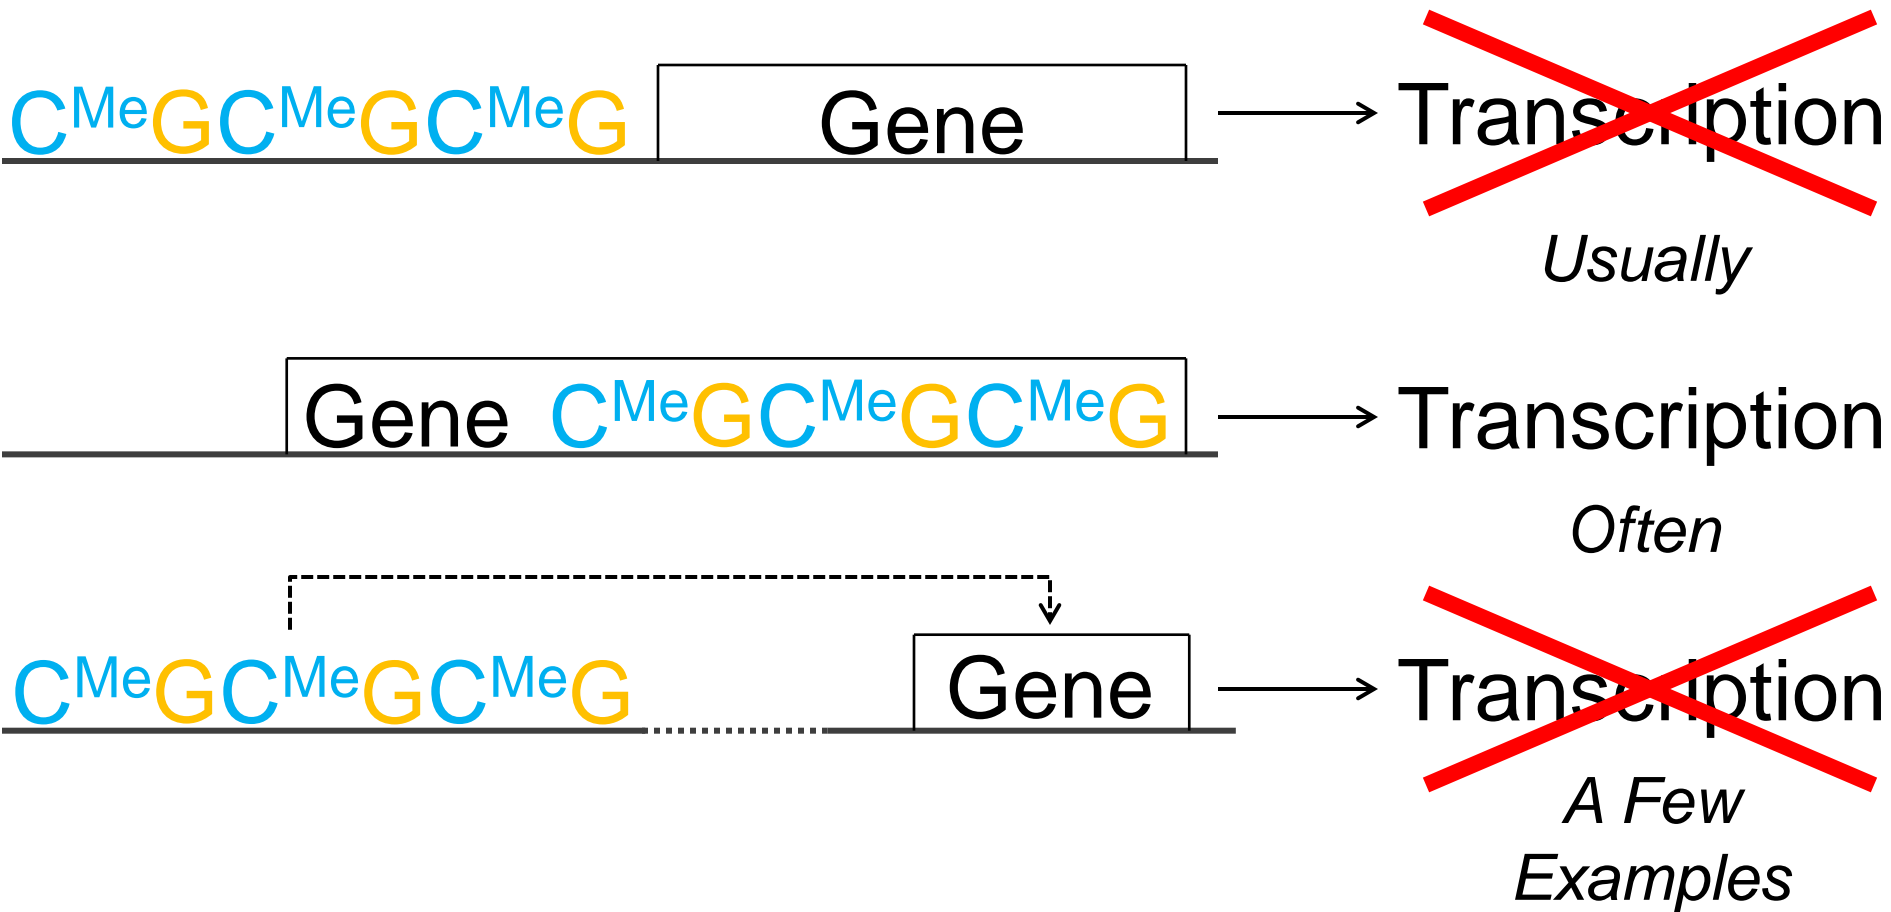

Bases outside genes can affect disease by *regulating transcription.*

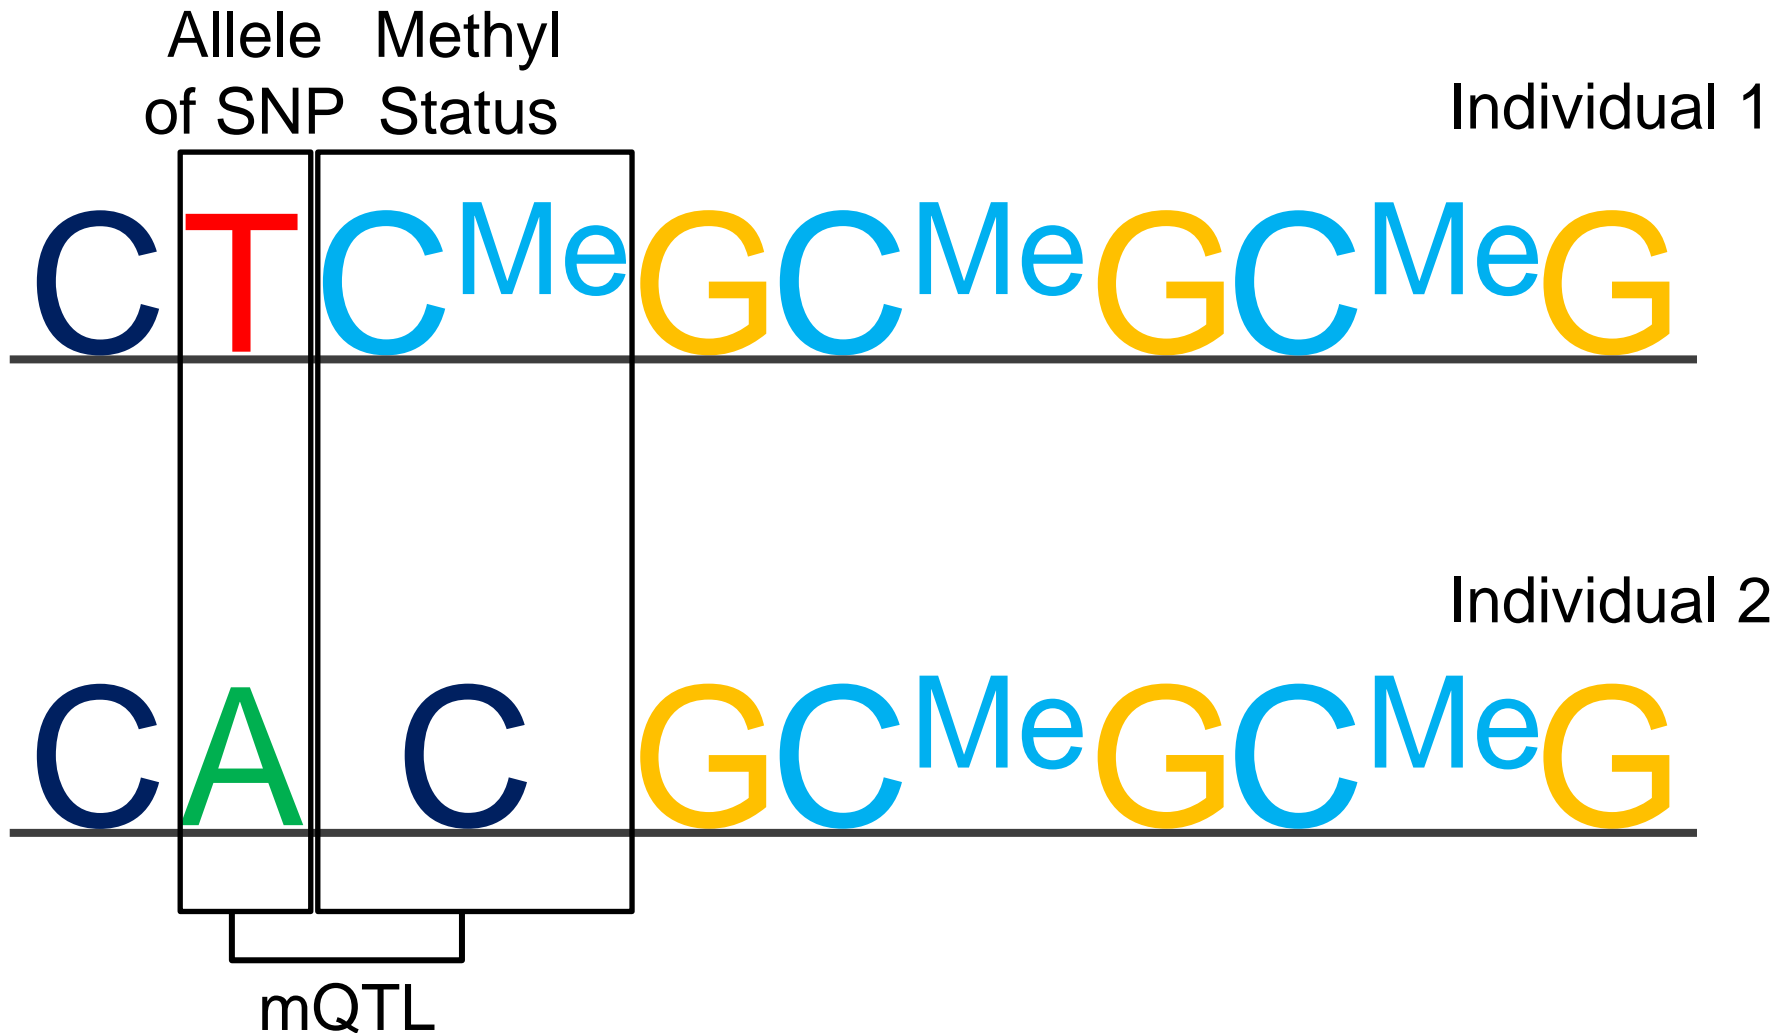

DNA Methylation

Role of Methylation in Transcription

Methylation Quantitative Trait Loci

mQTLs can have dramatic effects on transcription!

Heterozygosity

Allele

Status

From Mother

C T C Me G C Me G C Me G

From Father

C A C G C Me G C Me G

Goal of Our Study

- Question: *Which differences in DNA bases are associated with whether near-by Cs are methylated?*

– In other words, which SNPs are mQTLs?

mQTL?

C T C Me G C Me G C Me G

- Do these associations provide mechanisms that explain how SNPs may affect transcription or disease?

Outline

- Background

- Preliminary Results

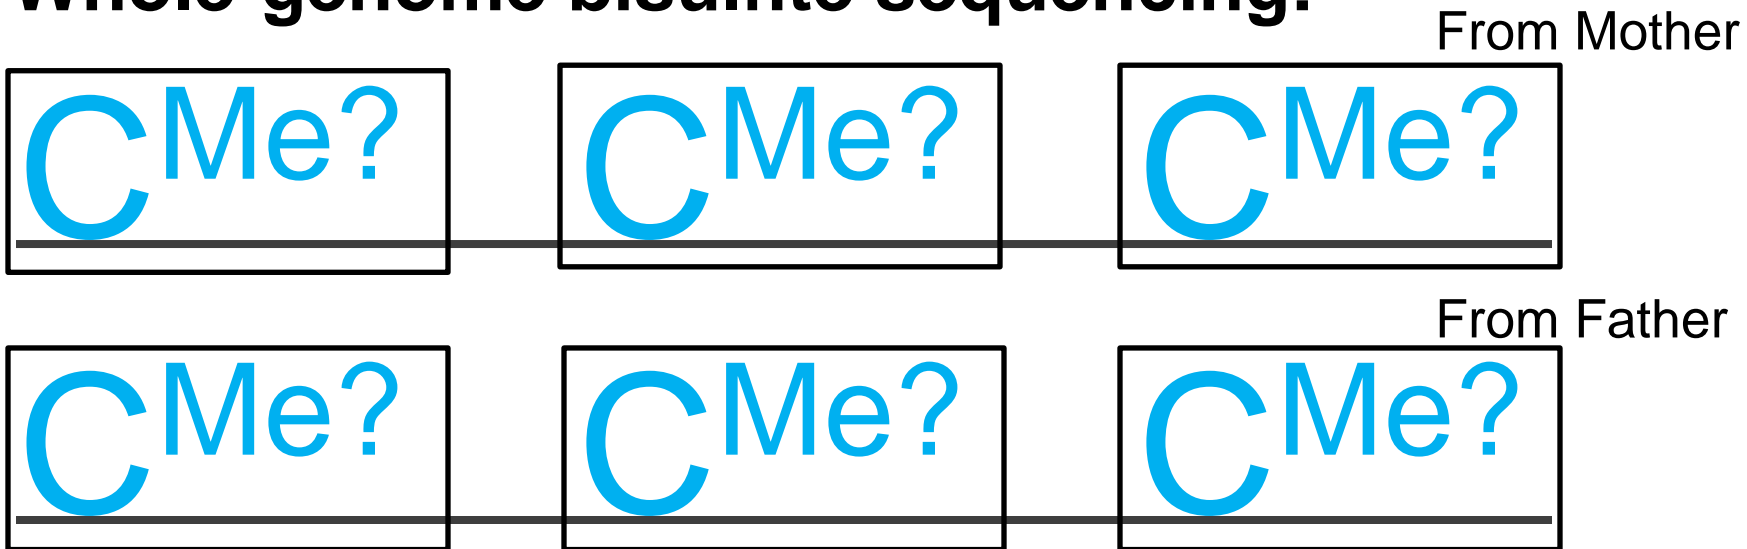

Identifying Cytosine Methyl Status

Methylation arrays:

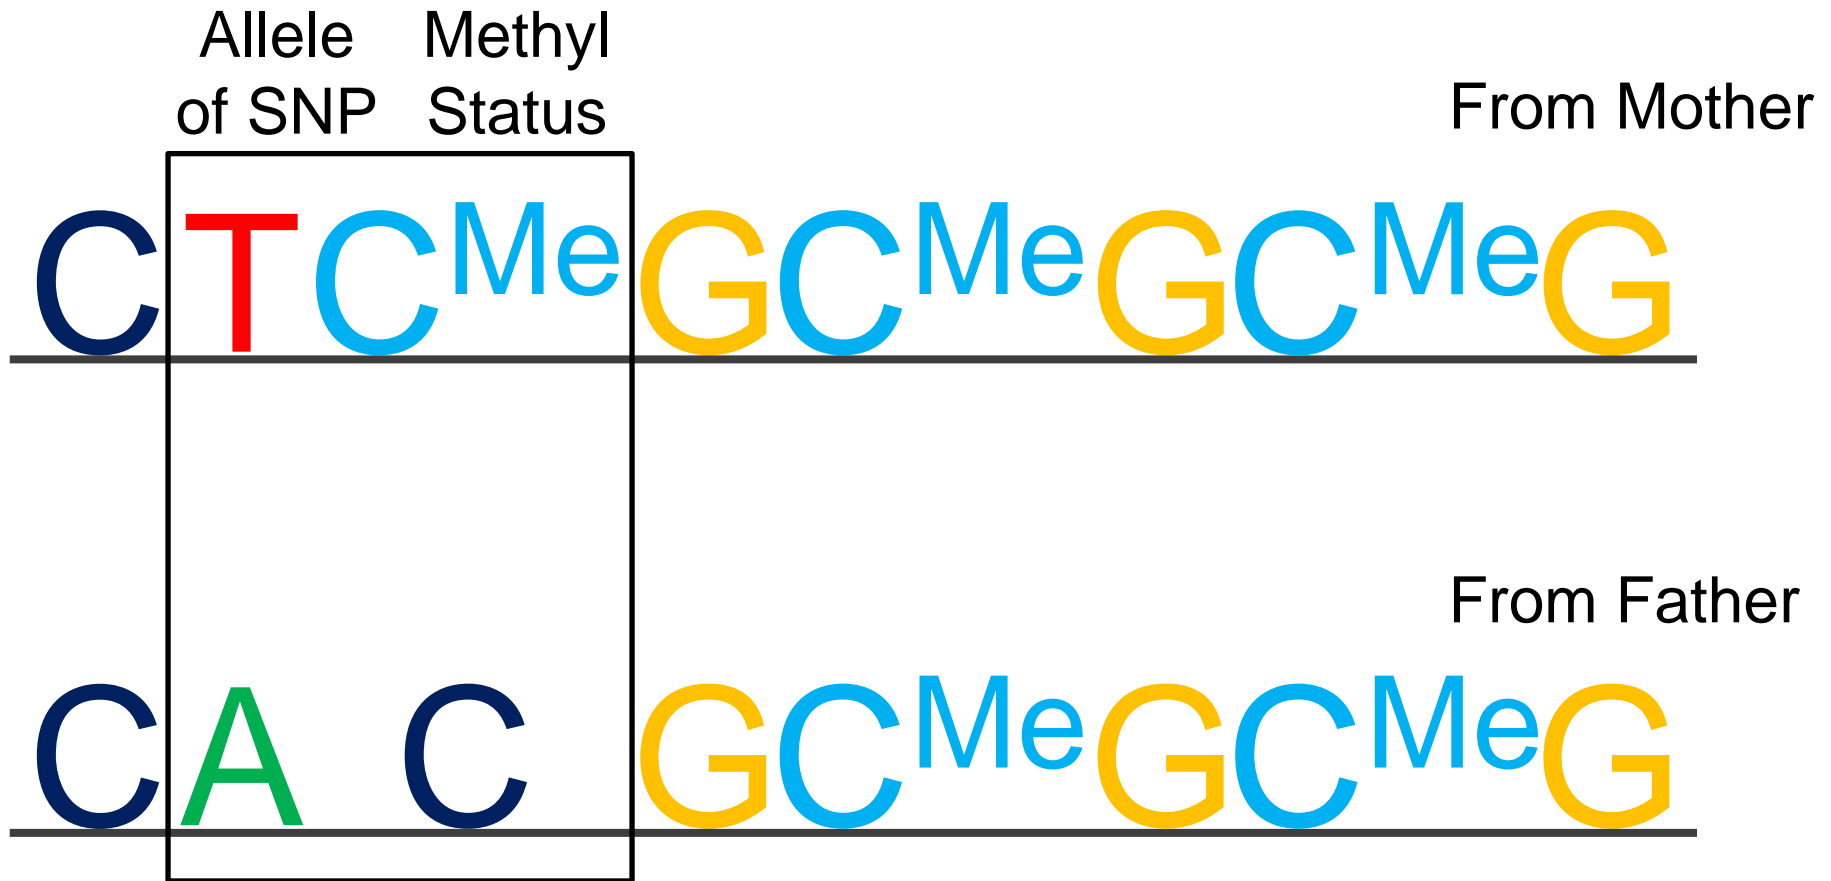

Also identifies alleles for only subset of SNPs

Whole-genome bisulfite sequencing:

Also identifies alleles for all SNPs for DNA from each parent

Methyl Arrays vs Bisulfite Sequencing

Methylation Array

Averaging

Bisulfite Sequencing

Expensive!

Bisulfite Sequencing on Pool

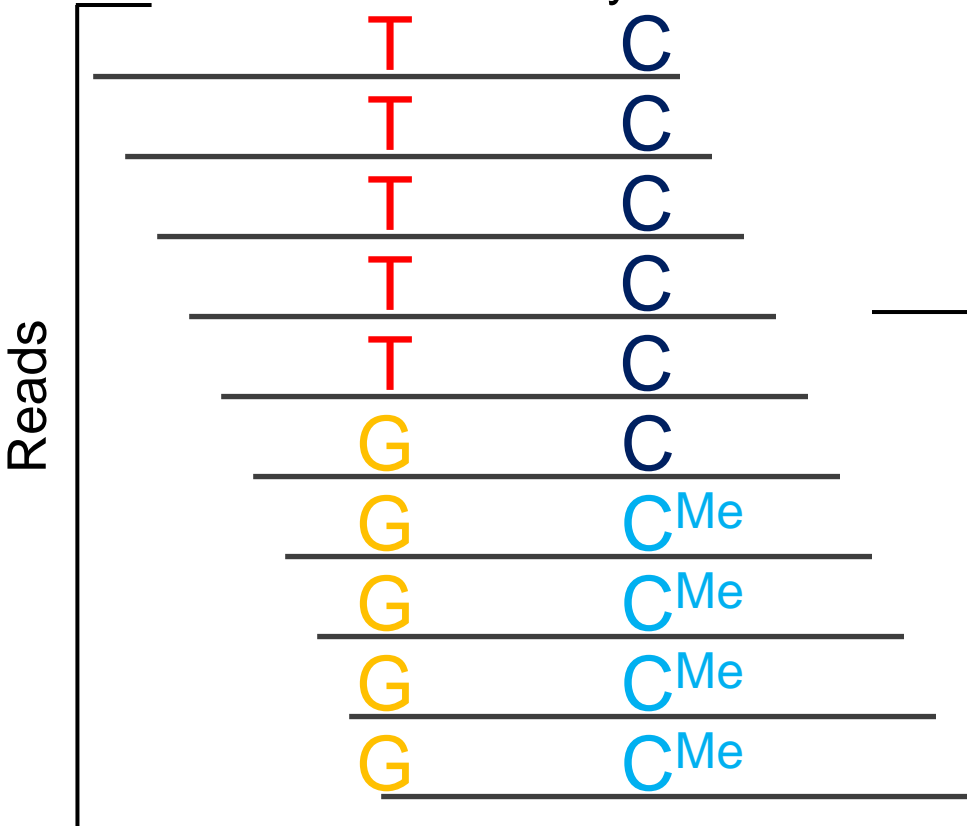

- Cell type: Lymphoblastoid cell lines (LCLs)
- Individuals: 60 Yorubans used in other studies

Identifying mQTLs from Pooled Data

Allele Methyl Status

	Unmethyl	Methyl
T Allele	5	0
G Allele	1	4

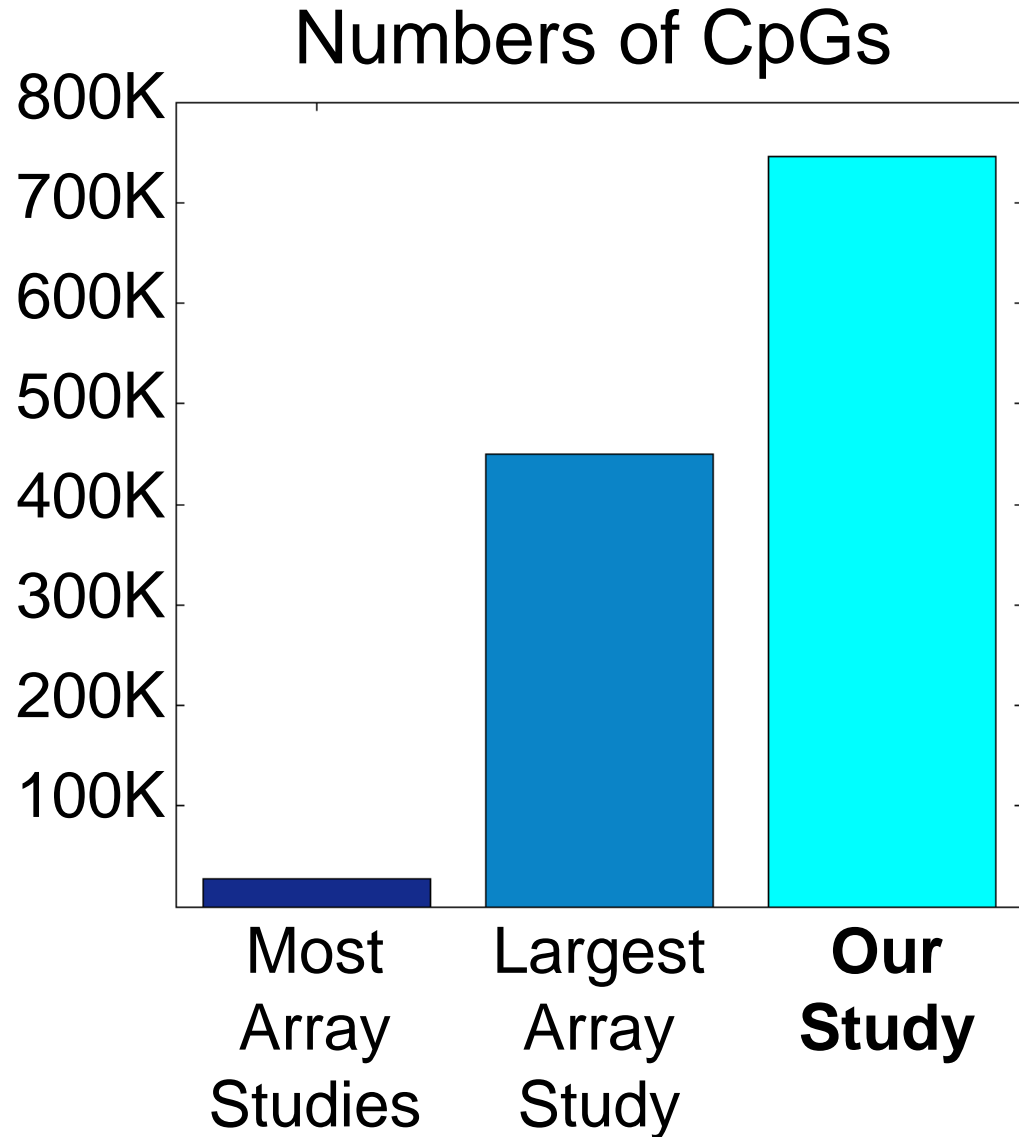

Fisher's Exact Test

Outline

- Background
- Methods
- **Preliminary Results**

Preliminary Results Summary

- Evaluated 746,210 CpGs
- 2,276 mQTLs
- Some overlap with:
 - SNPs associated with transcription
 - SNPs associated with physical traits

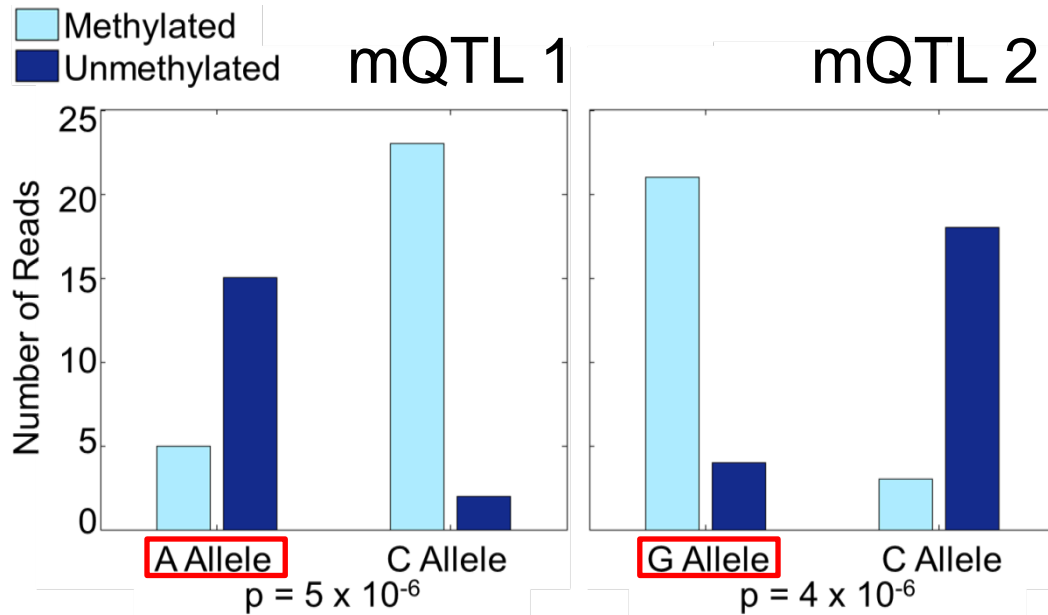

mQTL Overlaps with Disease SNPs

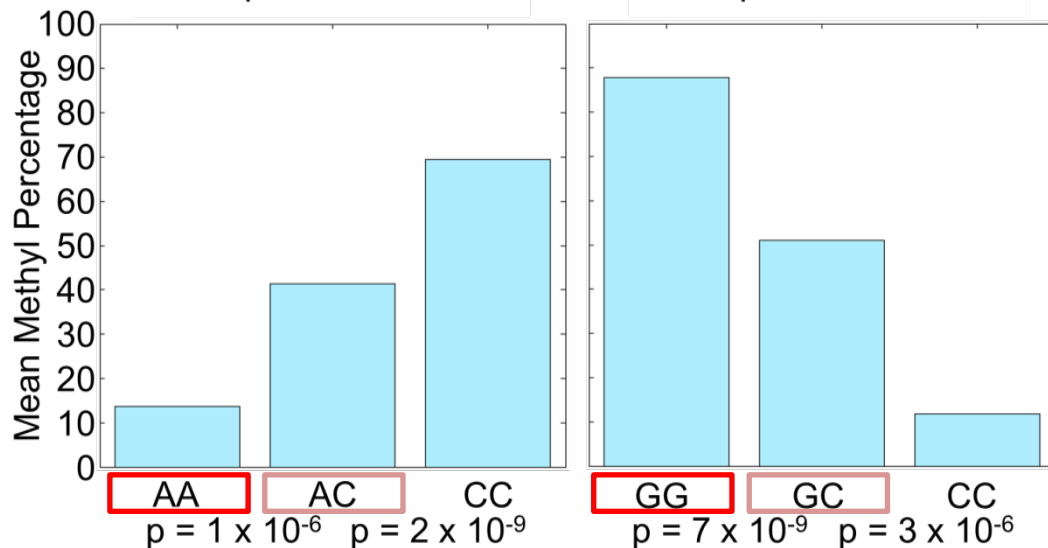

- 4 exact overlaps, including:
 1. SNP associated with age-related macular degeneration in multiple studies
 2. SNP associated with ratio of visceral adipose tissue to subcutaneous adipose tissue
 - Measure of obesity
- Not found in previous mQTL studies
- Validated these 2 overlaps using pyrosequencing

mQTLs and Their Validation

Bisulfite Sequencing

Pyrosequencing Validation

Contributions

- Provided novel pooling and association methods for identifying mQTLs
- Used these methods to identify over 2,000 mQTLs, most of which have not been found in previous studies
- Found mQTLs that are also associated with disease and transcription, suggesting a mechanism for influence of SNPs
